

Get rid of pitch problems with Buzyme enzymatic pitch solutions from Buckman.

Studies have shown the major troublesome component of wood resin is the triglycerides. Because they have no charge, fixation methods are ineffective. They defy conventional pitch control products like talc, detackifiers, dispersants and surfactants. So pitch is never truly eliminated from the system and can continue to agglomerate and re-agglomerate on the machine. And that creates big problems for your equipment, runnability and sheet quality.

Buzyme® works differently.

Its advanced enzymatic formula breaks down these triglycerides into fatty acids that can be easily fixed with a polymer. So pitch won't deposit and can be removed from the system.

With Buzyme you can:

- Reduce deposition
- Increase refiner and clothing life
- Decrease chemical usage

- Reduce downtime and washup
- Improve fiber-fiber bonding
- Significantly improve sheet quality with fewer breaks, spots and holes.
- Optimize bleach usage

Easily applied in thick stock, Buzyme is stable and biodegradable and is key to achieving optimal paper machine runnability.

Why just control pitch when you can eliminate it?

Don't let pitch stick around. Contact your Buckman representative or visit **buckman.com** to find out how easy it is to switch to Buzyme enzymatic pitch solutions.

SUCCESS STORY

The Challenge: An integrated newsprint mill wanted to reduce final sheet extractives while increasing final sheet strength without excessive use of strength additives.

The Solution: Buckman applied Buzyme enzymatic pitch solutions at the TMP transfer chest pump. The mill was able to achieve:

- A 44% reduction in final sheet extractives
- Significant reductions in Kraft and dry strength chemistry usage while maintaining strength targets
- Major improvements in logistics
- Significant reductions in filler addition while still maintaining friction targets

Return on Investment: \$200,000 per year
