

Influent gets cleaner. Your plant runs greener.

Clean water with low organics is critical for ultra-high pressure boilers. Use of Buckman's enhanced coagulation technology improves your boiler performance while reducing your operations' impact on the environment. Removing more organics from influent water means less contaminants to be removed by secondary treatment, reducing chemical requirements and the load on your ion exchange resins. RO units stay cleaner longer, too. Cleaner water to the boiler results in reduced blowdown and less freshwater usage.

For more information on how Buckman can help you remove organics and make your plant more sustainable, contact your local Buckman representative or visit us at buckman.com.

BuckmanTM
